

- This is how at the beginning wanted to display the products but it was a lot of but it was a lot of repetitive lines
- I changed my approach and i rendered all the items from item.js with javascript this way it's more efficient.

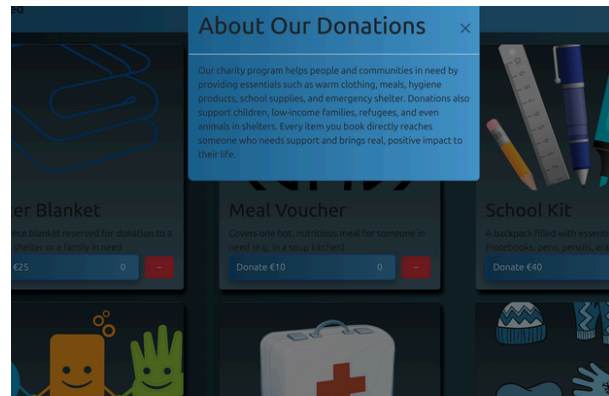

Components

1. Modal

I added this component in the nav since i did not want to leave the nav completely empty. Maybe this is not the appropriate way to use modal in the nav section. but i wanted to a little about page in the modal section so the user know where the donations go.

2. Close-button

In the top-right of the modal there is a close button component

3. Cards

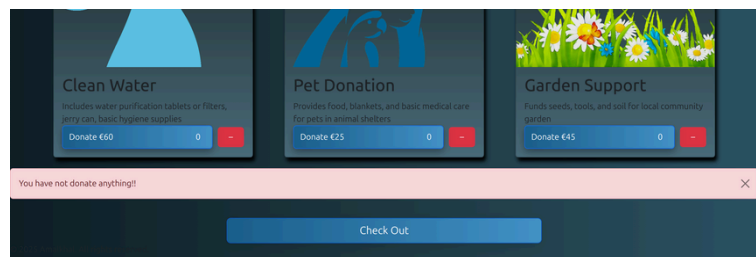

I used cards for the items, I think its the best component for this project.

4. buttons

i used inside the cards buttons from bootstrap

5. Alert

I used here the alert component if the user want to check out without donating anything this alert will show up, and let them know that they can't proceed yet

Submit form

Form

Here in the form where i have form validation check using javascript

Receipt

At the end here a receipt would show up as a modal where all the calculations has been done js. and a button that would take u to the home page again
